Prostate Cancer
What you should know...

More than 65% of all prostate cancers are diagnosed in men over age 65 and the chance of developing the disease rises after age 50.

**In 2016, it is expected**
- 180,000+ men will be diagnosed while
- 26,000+ men will die from the disease

1 in 7 men will be diagnosed with prostate cancer during their lifetime

African American men are more likely to develop prostate cancer by 56%

1 new case occurs

EVERY 2.4 MINS

EVERY 19.1 MINS

A man dies from prostate cancer

But the cure rate is very high

Prostate Cancer is very slow growing
sometimes taking
10-30 years before becoming life threatening

Here at Stanford
We offer targeted biopsy, an advanced screening option for prostate cancer, and the latest radiation therapy and surgical treatments, in addition to clinical trials.

Fun Fact
The Prostate Specific Antigen (PSA) detected in blood, and used to diagnose the cancer, is a protein originally discovered at Stanford
